

# Connecting getperfectspin.com — DNS Setup Guide

This covers what Cassie needs to do to point her domain, getperfectspin.com, at her Perfect Spin site. The domain has already been added on the hosting side (Vercel), so it's safe to make these DNS changes now. There are two ways to do it — she can either follow the steps herself, or grant JB access to make the changes for her. Both are below.

---

## The DNS records to add

At Squarespace, under the domain's DNS settings, add these two records exactly as shown:

| Type  | Name | Value                                |
|-------|------|--------------------------------------|
| A     | @    | 216.150.1.1                          |
| CNAME | www  | 7580b3dc94992b27.vercel-dns-016.com. |

The **A record** (@) points the root domain (getperfectspin.com) to Vercel. The **CNAME record** (www) points www.getperfectspin.com to Vercel as well — the site is set up so www is the production address and the root domain redirects to it.

If Squarespace already has an existing A record or CNAME on those same names (from before the domain was purchased or during setup), edit it to match the value above rather than adding a duplicate — a domain can only have one A record per name.

---

## Option 1: Cassie does it herself

1. Go to [account.squarespace.com/domains](https://account.squarespace.com/domains) and log into the account that owns getperfectspin.com.
  2. Click on the domain name in the list.
  3. Click **DNS** in the side panel.
  4. To edit an existing record, hover over it and click the pencil icon. To add a new one, use the add-record option on the same page.
  5. You'll be asked to confirm your password or two-factor code before changes are allowed.
  6. Enter the record details (Type, Name, Priority/TTL, Data) exactly as provided.
  7. Save the record.
  8. DNS changes can take **24-48 hours** to fully propagate, though it's often much faster.
- 

## Option 2: Cassie grants JB (or another developer) access to make the changes

This lets someone else manage DNS without ever seeing her login or billing info.

1. Go to [account.squarespace.com/domains](https://account.squarespace.com/domains) and log in.
2. Click on the domain name (getperfectspin.com).

3. Click the **Permissions** tab.
4. Click **Invite domain manager**.
5. Enter the name and email address of the person being invited (e.g. JB).
6. Send the invite — they'll get an email with a link to accept.
7. Once accepted, that person can manage DNS records and connect the domain to a site.

**What a domain manager CAN do:** - Manage DNS records - Connect the domain to a website - Add or remove other domain managers

**What a domain manager CANNOT do:** - See or touch billing/auto-renew - Delete the domain outright

This is the safer option if she'd rather not touch DNS settings herself — it hands over just enough access to get it connected, nothing more.

---

## After the records are saved

DNS changes can take anywhere from a few minutes to 24-48 hours to fully propagate. Once it's live, Cassie's /admin login for managing bookings will still redirect to comforterwash.com rather than staying on getperfectspin.com — that's expected. Login sessions can't be shared across separate domains, so this isn't a bug, just how the platform is built. Only the customer-facing site (booking, tracking, etc.) will live on her own domain.
